

Solve this Problems in dart programing language using only variables and operators

1. The Time Converter

Goal: Convert a total number of seconds into hours, minutes, and remaining seconds.

The Problem:

Given a variable totalSeconds set to 3665, write code to calculate the hours, minutes, and seconds and print the result in the format: Xh Ym Zs.

2. The Leap Year Validator (Boolean Logic)

Goal: Determine if a specific year is a leap year using only a boolean expression and logical operators.

The Problem:

A year is a leap year if:

1. It is divisible by 4, **AND**
2. It is **NOT** divisible by 100, **UNLESS**
3. It is also divisible by 400.

Create a variable year and a Boolean variable isLeap. Assign the result of the logic to isLeap and print it.

3. The Bill Splitter

Goal: Calculate how much each person pays for a meal, including tax, and format the result to exactly two decimal places (currency format).

The Problem:

Given a billAmount of 120.50, a taxRate of 10%, and numPeople as 3. Calculate the totalPerPerson and print it as a clean String (e.g., "44.18").
